- Reporting
- Rates

Take the Tour

Transportation Management System:

Web-based TMS with minimal start up costs, no server hardware/software to buy, low-cost pay per transaction (ASP) or license pricing.

Connectivity Leading Information to everything! Now using the Internet and even wireless communications, you can dramatically streamline operations, improve utilization, better track orders and trucks – and boost your bottom line.

Customized Work Flow For Your Business: CargoTel's software is easily customized according to how you and your users do business, not like other TMS systems, which require you to conform to their set of "assumptions".

Streamlined Operations: CargoTel's TMS can automate all aspects of your logistics operations to track order entry, dispatch, EDI, billing and payables, with nothing more than PCs and an Internet connection. Our TMS system is Web-based.

Rates and Brokerage: Make off-hours match, track, and manage your freight with third party carriers thereby boosting your brokerage profits. Loads can be opened to "competitive bidding" bidding using your own "Exchange" or even auto contract based on performance.

Integrated Wireless: CargoTel offers a low-cost interactive Truck Telephone, Driver Wireless and Inventory Management systems, which are completely integrated into the core TMS offering.
