Transportation Management System:

Web-based TMS with minimal start up costs, no server hardware/software to buy, low-cost pay per transaction (ASP) or license pricing.

Communicating information is everything!

Now using the Internet and even wireless communications, you can dramatically streamline operations, improve utilitization, better track orders and trucks – and boost your bottom line.

Customized How You Do Business: CargoTel's software is easily customized according to how you and your users do business, not like other TMS systems, which require you to conform to their set of "screens".

Streamline Operations: CargoTel's TMS can enhance all aspects of your logistics operations from order entry, dispatch, EDI, billing and payables, with nothing more than PCs and an Internet connection. Our TMS system is Web-based.

Enhanced Brokerage: More efficiently match, track, and manage your freight with third-party carriers therby boosting your brokerage profits. Loads can be opened to "competitive bidding" bidding using your own "Exchange" or even auto pushed based on performance.
